Figure 4 : TV Signal Identification Circuit.

S - 4032/1

TV signal identification circuit :

The suggested application circuit is shown in fig. 4.

The passive components are chosen as follows :

R₁ and R₂ : these define the AFC response slope.
 For R₁ = R₂ = 5.1 KΩ, the typical slope is 750/11 KHz/V (with AFC output unloaded).

S₁ : switches between low slope (LS) and high slope (HS). The high slope is typically 88/11 KHz/V.

R₃ and R₄ : the ratio (R₃ + R₄)/R₃ defines the digital AFC width (δf) calculated from the linear AFC width (2Δf). With V_s = 12 V, the relation is :

$$\delta f = 0.036 (2\Delta f) \frac{R_3 + R_4}{R_3}$$

R_{T1} : by means of this trimmer it is possible to align the linear tuning with the digital one, at the same frequency. The typical relation is :

$$R_a = 33 R_3$$

with $R_3 = 3.3 \text{ K}\Omega$, R_a can be a fixed resistor of $110 \text{ K}\Omega$.

To make better sensitivity adjustment of trimmer R_{T2} , it is necessary to use only a weak signal at the

antenna. The video information must be a black picture or a field of small white points on a black field. Furthermore, the action of the syncs separator must be as quick as possible.

In receivers with automatic program search, $S1$ should be in the HS position and then the components $S1$, $R1$ and $R2$ can be omitted completely.
